

Surviving and Thriving in a Multiplatform, Multilanguage, Multiproduct, Multisite Continuous Integration Environment

Surviving and Thriving in a Multiplatform, Multilanguage, Multiproduct, Multisite Continuous Integration Environment

In other words:

- ◆ **Know where your source came from**
- ◆ **Know what you are Building**
- ◆ **Know what you are Testing**
- ◆ **Know what you are Shipping**
- ◆ **Know what you are Supporting**

Assumptions

- ◆ Either racks full of discrete machines or Private Cloud Infrastructure
- ◆ Sane artifact versioning scheme
 - ◆ git short hash
 - ◆ revision major.minor.patch(.micro)
 - ◆ build number

Item 1 - Artifact Repository

Example: Artifactory

- ◆ Secure storage of your built components
 - ◆ third-party lib source
 - ◆ idl/idl bindings
 - ◆ libs, components, applications
 - ◆ installers, distribution packages
- ◆ Tool Chain utilities
 - ◆ cmake modules
 - ◆ gradle plugins
- ◆ Test Support
 - ◆ locally built or modified Ruby gems
 - ◆ VM Provisioning scripts (Chef recipes, cookbooks, etc.)

Item 2 - Source Repository

Example: local instance of github

- ◆ Source for
 - ◆ Components
 - ◆ Libs
 - ◆ Applications
 - ◆ Installers
- ◆ C++ Core moving to git flow
 - ◆ Development branch - nightly continuous integration tests
 - ◆ Master branch - released code, less frequent integration tests
 - ◆ Feature branches
 - ◆ short-lived targeted development for new feature
 - ◆ Merged into development branch

Item 3 - Automated Build Infrastructure

Example: JetBrains's TeamCity

- ◆ dedicated VMs
 - ◆ build agents organized by platform
 - ◆ Tool chain
 - ◆ Bitness
 - ◆ Windows – 18 platforms: WinXP, Vista, Win7, Win 8, Win8.1, Server 2003, Server 2008, Server 2012 plus 4 POS platforms
 - ◆ Linux – 8 platforms: RedHat and CentOS 5&6 (pending SuSE, RHEL7 CentOS7, Oracle Linux)
- ◆ Builds component, lib or application
 - ◆ Triggered by source commit
 - ◆ executes acceptance test after build
 - ◆ publishes artifact when acceptance test passes

Item 4 - Full Spectrum Testing

- ◆ C++ unit tests
 - ◆ google test, boost test - short running must pass before code review
- ◆ C++ acceptance tests - Ruby RSpec, Cucumber
 - ◆ short acceptance (10 min) executed post build, pre publishing to artifactory
 - ◆ long acceptance (60+ minutes) nightly development branch tests on every platform on Jenkins
- ◆ Automated and Ad hoc System, Scale and Performance tests
 - ◆ pulls artifacts from Artifactory
 - ◆ Chef (or Puppet) used for provisioning test infrastructure

Item 5 - Use the Right language for the Task

◆ Retrieve Artifacts

- ◆ Java, Ruby build target use gradle plugin
- ◆ C++ build target cmake maven resolver

◆ Create build environment

- ◆ cmake

◆ Acceptance tests

- ◆ Happy path: Ruby Cucumber
- ◆ Complex normal and abnormal behavior:
 - ◆ Ruby Rspec
 - ◆ Ruby Rake - Run tests without build environments

Item 6 - Collect Metrics

About everything

- ◆ Artifacts
 - ◆ Dependencies
 - ◆ Licenses and license attributions
- ◆ Build history
- ◆ Test history
 - ◆ acceptance
- ◆ Review daily
 - ◆ Are required to understand all failures
 - ◆ Tests
 - ◆ Test Harness failures
